WASDE-374

Approved by the World Agricultural Outlook Board

May 10, 2001

NOTE: This report presents USDA's initial assessment of U.S. and world crop supply and demand prospects and U.S. price prospects for the 2001/02 season. Also presented are the first projections of U.S. livestock product supply, use, and prices for the new year (2002 for animal products and 2001/02 for milk). Projections are based on economic analysis, normal weather, trends, and judgment.

Because planting of spring crops is still underway in the Northern Hemisphere and remains several months away in the Southern Hemisphere, these projections are highly tentative. Substantial variation may result from weather developments, economic factors, and policy changes. National Agricultural Statistics Service (NASS) forecasts are used for U.S. winter wheat. For other U.S. crops, the March 30 NASS Prospective Plantings report is used for planted acreage, and methods used to project harvested acreage and yield are noted on each table.

Foreign supply and demand balances in today's report incorporate significant historical revisions in USDA estimates of China's domestic consumption and stocks of wheat, rice, and corn. A discussion of the revisions and a comparison of old and new estimates begins on page 34. Complete revisions to USDA grain supply and demand estimates for China are available at <http://www.usda.gov/oc/oce/waob/wasde/wasde.htm>.

WHEAT: The 2001/02 outlook for U.S. wheat is for a smaller crop, reduced use, declining stocks, and higher prices. Total production is projected down 12 percent from 2000/01 to 1,961 million bushels. The survey-based forecast of winter wheat production is 14 percent below last year because of lower area and yields. Using planting intentions and average harvested-to-planted ratios and yields results in lower spring wheat (including durum) production. The smaller crop and reduced carryin stocks drops total 2001/02 supplies almost 12 percent below a year earlier to the lowest level since 1996/97.

Projected 2001/02 use is down from a year earlier. Domestic use is expected to drop as feed and residual use declines in response to smaller wheat supplies and more attractive corn prices. Exports are expected to drop because of strong competition from foreign exporters. Nevertheless, use is projected to exceed production and 2001/02 ending stocks are projected down around 240 million bushels from the forecast carryin level. Given the lower ending stocks, the projected price range for 2001/02 is \$2.75 to \$3.35 per bushel, compared with an estimated \$2.63 for 2000/01.

Projected 2001/02 global wheat production and stocks are down from a year earlier. Foreign wheat production is down slightly as smaller crops in the EU, India, Pakistan, and several other countries more than offset bigger prospective crops in Russia, Ukraine, Eastern Europe, Australia, Argentina, and a number of other countries. Global imports are projected up slightly because of relatively small increases in a number of countries, especially in Asia. Partially offsetting these gains are lower expected imports by North Africa, Brazil, and Eastern Europe because of larger crops. Exportable supplies in the major foreign exporters will be down only slightly as bigger carryin stocks for Canada and the EU and bigger crops in Argentina and Australia will largely

offset the sharply lower EU crop. In addition, India is expected to continue to export in order to reduce burdensome stocks. Thus, the higher priced U.S. wheat is expected to face intense competition in a continued weak global market.

COARSE GRAINS: The U.S. 2001/02 corn crop is projected at 9,575 million bushels, down 4 percent from last year. Projected production is based on March Prospective Plantings, harvested-to-planted relationships for recent years, and a trend yield adjusted for planting progress. However, the smaller crop is largely offset by higher expected carryin stocks and total 2001/02 corn supplies are down only around 1 percent.

Total corn use in 2001/02 is expected to be little changed from a year earlier. Domestic use is expected to decline slightly as expanding industrial use largely offsets reduced feed and residual use because of declining numbers of cattle on feed. U.S. corn exports are projected to increase slightly because of a little less competition from foreign exporters. With total use only slightly larger than the expected crop, U.S. 2001/02 ending stocks of corn will be close to the forecast carryin level. The projected price range for corn is \$1.65 to \$2.05 for 2001/02, compared to \$1.80 to \$1.90 for 2000/01.

Forecast 2000/01 ending stocks of corn are up 47 million bushels from last month because of reduced exports.

Global 2001/02 coarse grain production and use are up sharply from a year earlier, but ending stocks are lower. Larger coarse grain crops are expected in China, Eastern Europe, the EU, Mexico, Canada and a number of other countries. Global corn imports are expected to drop slightly from a year earlier as reductions for South Korea and Japan offset small gains in a number of countries. China's corn exports are projected at 5 million tons, down 2 million from 2000/01. Brazil is expected to remain an exporter but to export less than in 2000/01. The United States and China account for most of the reduction in the 2001/02 global coarse grain ending stocks from a year earlier.

RICE: U.S. rice production in 2001/02 is projected at 186 million cwt, down 3 percent from 2000/01. Planted area, based on the NASS *Prospective Plantings*, is up 1 percent from 2000. Rice yield is projected at 6,061 pounds per acre, down 3.5 percent from the 2000/01 record. Long-grain rice production is projected at 135.5 million cwt, up 5 percent, and combined medium- and short-grain rice production is projected at 50.5 million cwt, a decrease of nearly 19 percent. While domestic and residual use is projected at a record 122.9 million cwt, up 1.3 percent from 2000/01, exports are projected 8 percent lower at 76 million cwt. Rough rice exports at 27 million cwt are equal to 2000/01. Ending stocks for 2001/02 are projected to decline 10 percent to 21.9 million cwt, including 11.8 million cwt of long-grain rice and 8.7 million cwt of combined medium- and short-grain rice. Rice prices are expected to be under pressure from continued low global prices and intense competition among the major exporters. The season-average price range for 2001/02 is projected at \$5.25 to \$5.75 per cwt compared to a revised \$5.55 to \$5.65 per cwt for 2000/01. No changes are made to 2000/01 supply and use estimates from last month.

This month, USDA made historical revisions to supply and use balances for China and Vietnam. For China, supply and use are revised beginning with 1980/81 to reflect a higher level of stocks and lower consumption. As a result, ending stocks for 2000/01 are revised to 95 million tons compared to last month's estimate of 20 million tons. The historical rice supply and use series for Vietnam is revised beginning with 1995/96 to include stocks. Estimates of Vietnam's rice stocks were developed based on input from the agricultural attache in Hanoi and market analysis. Ending stocks in Vietnam in 2000/01 are estimated at 900,000 tons.

Global 2001/02 rice production is projected at 399.9 million tons assuming normal global weather, up slightly from 2000/01 but down 2 percent from the record 1999/2000 crop. World consumption is projected at a record level. Global exports in 2001/02 are expected to remain nearly flat compared to the levels of 2000/01 and 1999/2000. Ending stocks in 2001/02 are projected to decline slightly for the second consecutive year.

OILSEEDS: U.S. oilseed production for 2001/02 is projected to increase by 6.9 million tons, or about 8 percent, to a record 92.2 million tons. Soybean production will account for most of the gain, rising 7.8 percent to a record 2,985 million bushels, or 81.2 million tons. Other U.S. oilseed production is expected to increase by about 1 million tons, led by gains in cottonseed and canola production. Soybean production is based on intended record soybean planting of 76.7 million acres and a trend yield of 39.5 bushels per acre. Soybean supplies are projected to increase by over 7 percent to a record 3,283 million bushels. A modest increase in domestic soybean crush is partially offset by reduced export prospects, resulting in a carryover of 500 million bushels, almost double the forecast 2000/01 level. U.S. soybean and soybean meal export prospects are reduced because of record competitor supplies, particularly in the first half of the marketing year. In contrast, soybean oil exports are forecast to grow strongly as global vegetable oil stocks tighten in response to reduced supplies of high-oil-content oilseeds and a prospective slowdown in palm oil growth.

Global oilseed production for 2001/02 is projected at a record 319 million metric tons, up about 12 million tons from 2000/01, with most of the gain in the United States. Total foreign supplies are projected up about 4 million tons to 251 million tons, with record soybean carryin stocks accounting for half of this increase.

U.S. season-average soybean prices for 2001/02 are projected to decline to \$3.90 to \$4.50 per bushel, compared with an estimated \$4.40 per bushel in 2000/01. This would be the fifth consecutive annual price decline, to the lowest average price in 30 years. Soybean meal prices are projected to decline to \$145 to \$170 per short ton, compared with \$168 per ton for 2000/01. Soybean oil prices are projected higher at 13.5 to 16.5 cents per pound.

For the 2000/01 crop year, global oilseed output is estimated at 307.7 million tons, up 0.9 million from last month. South American soybean output is raised 1.3 million tons, due mostly to a 1-million-ton increase in Brazil to a record 36.5 million tons. Offsetting changes include reductions for Indian rapeseed and sunflowerseed production in Europe.

U.S. soybean crush for 2000/01 is increased 5 million bushels in response to an increase in meal exports, to 6.9 million short tons.

SUGAR: Projected U.S. sugar production for fiscal year 2001/02 is 8.435 million short tons, raw value, down slightly from 2000/01. Beet sugar production is projected down 3.8 percent to 4.25 million tons. Based on trend, beet sugar yield is projected at 3.12 tons per acre, down from 3.29 tons per acre estimated for 2000/01. Total area for sugarbeets excludes Washington State because the processing facility is not scheduled to operate. Projected cane sugar output is up 2.6 percent, to 4.185 million tons, based on projected area harvested and trend yields and sugar recovery rates.

Projected 2001/02 non-quota imports are 390,000 tons, including 25,000 tons of high-tier tariff entries, 250,000 tons under the re-export programs, 100,000 tons under USHTS 1702904000, and 15,000 tons for use in polyhydric alcohol. The 2001/02 tariff rate quota (TRQ) has not been announced. On the use side, deliveries, at 10.44 million tons, are projected up 0.9 percent from a year earlier.

For 2000/01, cane sugar production is up slightly this month with higher production in Florida and Texas more than offsetting a decrease in Hawaii. Imports under the TRQ are decreased 30,000 tons to reflect increased surrender of Certificates for Quota Eligibility. Non-quota imports are increased 5,000 tons as a 30,000-ton increase under the Refined Sugar Re-export Program more than offsets a 25,000-ton decrease under USHTS 1702904000. Estimated end-of-season stocks are 1.946 million tons, and the stocks-to-use ratio is 18.6 percent.

LIVESTOCK, POULTRY, AND DAIRY: Total U.S. meat production in 2002 is projected higher because of increased pork and poultry production. Beef production will continue to fall as cattle inventories decrease and producers hold back heifers and cows for breeding. Although slaughter is forecast to decline in 2002, weights will rise as relatively low grain prices and demand for Choice beef encourage feeding to heavier weights. Pork producers are gradually expanding production in 2001 and the slow rate of expansion is forecast to continue through 2002. Growth in broiler production will resume in 2002 after holding steady in 2001.

Production estimates for 2001 are lowered from last month as first-quarter broiler and beef production were weaker than expected. First-quarter broiler production was below a year ago due to poor returns, and production forecasts are reduced for the second half. Pork production is forecast slightly higher than last month.

In 2002, U.S. meat exports are projected to increase, mainly due to continued growth in broiler meat exports. Beef and turkey exports are also expected to rise, and pork shipments will remain steady. U.S. meat imports in 2002 are forecast to rise as both beef and pork imports increase.

Forecast broiler meat exports in 2001 are raised sharply this month due to increased shipments to Russia and Hong Kong. Pork exports also are boosted due to strong shipments in the first quarter. Meat imports in 2001 are revised downward because of lower expected pork imports during the first half.

Cattle prices in 2001 are forecast higher than last month as demand remains strong and supplies are expected to tighten later this year. As supplies tighten further in 2002 and demand for Choice grade beef remains firm, prices are expected to climb. Hog prices in 2001 are raised this month, supported by strong demand through most of the year. However, increased production is expected to begin weighing on the market in the last quarter and into 2002, pushing prices below a year earlier. Poultry prices in 2001 have begun to increase in response to moderate production growth and are expected to continue above a year earlier through 2002.

Milk production in 2001/02 is forecast to expand as higher milk prices slow the rate of decline in cow numbers and milk output per cow increases. For 2000/01, milk production is forecast to decline about 1 percent. Milk per cow fell below year-earlier levels during December through March, but is forecast to begin recovering by summer. Cow numbers are expected to remain below a year earlier.

Commercial use is firm, helping to support product prices. Due to stronger cheese prices, the forecast for the 2000/01 Class III price is increased this month to \$11.75 to \$11.95 per cwt. The Class IV price is raised to \$13.50 to \$13.80 per cwt due to strong butter prices. The all milk price is forecast at \$14.10 to \$14.30 per cwt.

Although larger milk production is expected in 2001/02, prices are likely to remain high. The Class III price is projected at \$11.90 to \$12.90 per cwt, the Class IV price declines to \$12.10 to \$13.30, per cwt, and the all milk price is projected at \$13.65 to \$14.65 per cwt.

COTTON: The first U.S. estimates for 2001/02 reflect higher production, exports, and ending

stocks. Production is projected at 18.8 million bales, based on average abandonment and yields. Domestic mill use is projected at 9.0 million bales, down slightly from 2000/01 as competition from textile imports more than offsets growth in retail demand. U.S. cotton exports are projected at 9.0 million bales, the largest since 1994/95. Exports are expected to benefit from a modest recovery in world consumption, large exportable supplies in the United States, and strong pre-season sales. Despite larger exports, stocks are expected to rise to a burdensome 6.3 million bales, or 35 percent of total use.

World production and consumption for 2001/02 are both projected at 93.0 million bales. World production is expected to rise despite current low world prices, largely due to government policies supporting production in several countries. Growth in world GDP and the lagged effect of low prices are expected to boost world consumption by 1.4 percent, slightly above the long-run average growth rate. World trade is also expected to rise slightly. Ending stocks are projected at 37.1 million bales, unchanged from 2000/01.

For 2000/2001, U.S. ending stocks are raised this month. Domestic mill use is reduced 100,000 bales, reflecting a continued decline in retail consumption. Exports are reduced 500,000 bales, as weekly export shipments have not kept pace with export commitments, indicating likely deferral or cancellation of export sales. The slowdown is linked to problems in the U.S. retail market that are depressing textile activity and cotton imports by Mexico, and to continued financial problems in Turkey.

Approved by the Secretary of Agriculture and the World Agricultural Outlook Board, Gerald A. Bange, Chairperson, (202) 720-6030. This report was prepared by the Interagency Commodity Estimates Committees. Committee members are listed on page 38.

APPROVED:

KEITH J. COLLINS
ACTING SECRETARY OF AGRICULTURE

1/ Fiscal years beginning Oct 1. Includes Puerto Rico. 2/ Historical data are from FSA, "Sweetener Market Data" except imports from U.S. Customs Service. 3/ Projections for 2001/02 are based on analyses by the Interagency Commodity Estimates Committee for sugar. 4/ Production by state for 2000/01 (projected 2001/02): FL 2,054 (2,060); HI 240 (270); LA 1,570 (1,675); TX 200 (165); PR 15 (15). 5/ Actual arrivals under the tariff rate quota (TRQ) with late entries, early entries, and TRQ overfills assigned to the fiscal year in which they actually arrived. The 2000/01 available TRQs assume shortfall of 65,000 tons. 6/ Quota exempt imports (for reexport, for polyhydric alcohol, sugar syrup under USHTS 1702904000, and high-duty). 7/ Mostly reexports. 8/ Transfer to sugar containing products for reexport, for nonedible alcohol, and feed. 9/ For 1999/2000, includes residual statistical discrepancies. 10/ For 2000/01 and 2001/02, includes only sugar owned by the Commodity Credit Corporation, as of May 8, 2001. Season-ending CCC stocks will be a function of market and program developments.

1/ Upland and extra-long staple; marketing year beginning August 1. Totals may not add due to rounding. 2/ Based on Bureau of Census data. 3/ Reflects the difference between the previous season's supply less total use and ending stocks based on Bureau of Census data. 4/ Cents per pound for upland cotton. The 2000/01 price is a weighted average for August-March. 5/ USDA is prohibited by law from publishing cotton price projections. * Planted area reported in March 30 "Prospective Plantings." Projected harvested area based on 1991-2000 average acreage abandonment by State. Projected yield based on 1991-2000 average yield by State.

Note: Public Law 106-78, signed October 22, 1999, requires the Secretary of Agriculture to estimate and report the U.S. upland cotton season-ending stocks-to-use ratio, excluding projected raw cotton imports but including the quantity of raw cotton imports that has been imported during the marketing year. Pursuant to this requirement, the estimated ratio for 2000/01 is 36.1 percent.

=====
1/ Data based on local marketing years except Argentina and Brazil which are adjusted to an October-September year. 2/ World imports and exports may not balance due to differences in local marketing years and to time lags between reported export and imports. Therefore, world supply may not equal world use.

3/ Argentina, Brazil and Paraguay. 4/ Japan, China, and EU, Mexico, and Southeast Asia (includes Indonesia, Malaysia, Philippines, and Thailand).

3/ Includes commercial exports. 4/ Includes products exported under the Dairy Export Incentive Program. 5/ Basic Formula Price through Dec. 31, 1999;

Class III price beginning Jan. 1, 2000 6/ Milk of average fat test. Does not reflect any deductions from producers as authorized by legislation.

Note: Tables on pages 31-33 present a 20-year record of the differences between the May projection and the final estimate. Using world wheat production as an example, changes between the May projection and the final estimate have averaged 14.4 million tons (2.7%) ranging from -32.5 to 29.7 million tons. The May projection has been below the estimate 12 times and above 8 times.

1/ See pages 31 and 32 for record of reliability for U.S. wheat, rice, soybeans, and cotton. 2/ Final estimate for 1981/82-99/00 is defined as the first November estimate following the marketing year and for 2000/01 last month's estimate. 3/ May not total 20 for crops and 19 for animal production if projection was the same as the final estimate. 4/ Calendar years 1982 thru 2000 for meats and eggs; October-September years 1981/82 thru 1999/2000 for milk. Final for animal products is defined as latest annual production estimate published by NASS.

Revised Estimates of China Grain Consumption and Ending Stocks

Supply and demand estimates for grain published in the May 10 World Agricultural Supply and Demand Estimates (WASDE) report incorporate significant revisions of USDA's estimates of China's grain consumption and stocks. China's government does not publish estimates of grain stocks. In the past, USDA's independent estimates of stocks performed well as an indicator of China and world grain market conditions. Recently, however, new information from China's first agricultural census, official statements, and evidence from trade and price patterns indicated that revisions in stock estimates were needed to reflect more accurately grain supply and use in China.

Domestic consumption and ending stocks of wheat, rice, and corn for China were revised beginning with the 1980/81 marketing year for wheat and rice and with 1978/79 for corn. Revised historical supply and demand estimates for each crop and coarse grains are available at <http://www.usda.gov/oce/waob/wasde/wasde.htm> in spreadsheet format. Revised estimates for coarse grains only reflect changes in corn use and stocks; estimates for the other coarse grains were not revised. The table on page 36 summarizes consumption and stocks revisions by crop since 1991/92. China's combined stocks of wheat, rice (milled basis), and coarse grains at the end of crop-specific marketing years for 2000/01 are now estimated to total 230.1 million metric tons, or 61 percent of annual domestic consumption. Prior to the revision, the April 10, 2001, WASDE report placed combined stocks at 66.1 million tons, or 17.3 percent of consumption. The table on page 37 shows revised estimates of world grain use and ending stocks.

USDA's grain stock estimates for China include only the portion of total grain supplies that could potentially enter the commercial market. Components include grain stocks acquired and held by government agencies, inventories in the commercial sector, and a portion of the grain that China's farmers grow and store locally for their own use. USDA assumes that 20 percent of the estimated on-farm supplies could enter the market in response to price fluctuations. The assumption is based on findings of a 1995/96 survey of on-farm grain storage and farmer attitudes by China's grain researchers.

USDA's prior estimates of China stocks were considerably lower than target levels mandated by internal grain policies, and well below total grain stock estimates recently reported in the China press. USDA's revised grain stock levels for China are more consistent with China's food policies. China prefers to hold large grain stocks as insurance against catastrophic crop failures, regional imbalances, or other disruptions that could constrict food supplies or force heightened reliance on imports. China's target stock levels, relative to yearly needs, are above those of many other countries or the levels recommended for optimum food security by the Food and Agriculture Organization of the United Nations (FAO).

Recently, China officials have made public statements regarding grain stocks. The China Daily of December 6, 2000, reported a senior government official as stating that China has 250 million tons of state grain reserves plus a conservative estimate of an additional 135 million tons of grain in on-farm storage. On March 13, 2001, the China Daily reported that China's total grain reserve was about 500 million tons. FAO reviewed China's historical supply and demand balances for cereals, and concluded that China may have 362 million tons of cereals available at the end of crop year 2000/01 (FAO Food Outlook, February 2001).

Market conditions in China provide another indicator that stocks are larger than USDA previously estimated. There is no indication currently of tightness in China's grain market, even though combined output of wheat, rice, and corn in 2000/01 dropped 41 million tons from the previous year. Also, there are no indications that China will import unusually large quantities of grain in marketing year 2001/02. In recent months, China has held several public auctions to sell off inventories of old grain purchased as long ago as 1996.

In revising historical supply and demand estimates for China, USDA lowered consumption but did not make changes to production or trade. Following its first agricultural census in 1997, China made major revisions in agricultural statistics, including reductions in animal inventory numbers and meat output. These changes implied that USDA had overestimated feed use of coarse grains and low-quality wheat and rice. Accordingly, USDA reduced feed use rates to reflect these changes when preparing the revised grain stock estimates. In addition, USDA adjusted historical estimates of China's per capita grain consumption to remove unusual year-to-year fluctuations. The cumulative effects of these adjustments on feed use and consumption from earlier years raised current stock levels.

USDA estimates of China's grain stocks are intended to reflect inventories held at the end of each crop's marketing year: July-June for wheat, October-September for corn, and January-December for rice. Grain stock estimates from other sources may be higher than USDA estimates if they reflect inventories at an earlier point in the marketing year.

In conclusion, the sharp upward revisions in China's grain stocks provide a more accurate picture of the supplies underlying China's current grain situation. At the same time, the resulting increase in world grain stocks relative to use changes historical relationships, and will require analytical models to be recalibrated.
